CONSTRUÇÃO DOS PROCESSOS DA DEMETECH (AGROBOT)

Trabalho apresentado no curso de
graduação da Faculdade de
Tecnologia de São Bernardo do
Campo “Adib Moises Dib”.

Orientador: Profº. Rafael Russi

São Bernardo do Campo – SP
Dezembro/2025

Dedicatória

Dedicamos este trabalho a nossos pais, o qual, nos deram forças para continuar a faculdade. E aos professores, que nos mostraram qual caminho trilhar quando nos deparamos com obstáculos na montagem do robô e da monografia.

Agradecimentos

Agradecemos primeiramente a Deus por nos ter concedido a honra de cursar esta faculdade, além de nos ajudar com as nossas lutas diárias. Aos nossos pais e irmãos, aos quais tem no dado incentivo para prosseguir neste caminho árduo. Também aos professores, que apesar do seu tempo escasso, conseguiram nos orientar e corrigir esta monografia de forma tão diligente, e, sempre dando apoio necessário para a conclusão do projeto.

"Transformar desafios em oportunidades:
essa é a essência da manufatura do futuro."

Resumo

Este projeto tem como objetivo desenvolver toda a estrutura de uma empresa, abrangendo tanto o planejamento físico de suas instalações quanto o design detalhado de seus processos operacionais e sistemas de rede. O trabalho apresenta uma abordagem integrada que inclui organização espacial, fluxo de produção, gestão de recursos e as redes de comunicação e logística necessárias para garantir eficiência, qualidade e continuidade operacional. Por meio desse planejamento abrangente, o projeto busca estabelecer uma base sólida para um ambiente industrial funcional, otimizado e bem coordenado.

Palavras-chave: projeto, estrutura, produção, design, industrial

Abstract

This project aims to develop the complete structure of a company, encompassing both the physical planning of its facilities and the detailed design of its operational processes and network systems. The work presents an integrated approach that includes spatial organization, production flow, resource management, and the communication and logistics networks required to ensure efficiency, quality, and operational continuity. Through this comprehensive planning, the project seeks to establish a solid foundation for a functional, optimized, and well-coordinated industrial environment.

KeyWords: project, structure, production, design, industrial.

1. Introdução

A Indústria 4.0, também conhecida como manufatura avançada, representa uma transformação industrial moderna, impulsionada pelo avanço da tecnologia digital. Esta nova era permite a incorporação de comunicação entre robôs na linha de produção, gerando fábricas inteligentes que se ajustam à customização de produtos. A melhora significativa na eficiência e rapidez das produções possibilita às empresas aumentar seus lucros e gerenciar de forma mais eficaz a conclusão dos produtos.

O início das revoluções industriais se dá com a Indústria 1.0 no começo do século XIX, caracterizada pela mecanização e pelo desenvolvimento de máquinas a vapor, principalmente por James Watt, que deu início à produção em grande escala na Inglaterra. Posteriormente, a Indústria 2.0 introduziu a eletricidade e novas técnicas de produção em larga escala, com a estruturação do trabalho e as linhas de produção influenciadas por Henry Ford. Em sequência, a Indústria 3.0 se destacou entre 1960 e 1970, e foi responsável pela automação das linhas de produção, com a implementação de sistemas computacionais e eletrônicos, além da robótica, que permitiram um controle mais acurado dos processos.

Já a Indústria 4.0, concebida na Alemanha em 2011, estabelece fábricas inteligentes, nas quais máquinas e sistemas interagem, maximizando a adaptabilidade e eficácia dos processos. A nova era engloba tecnologias como IoT (Internet das Coisas), Big Data, Inteligência Artificial e Aprendizado de Máquina, que potencializam a eficiência e a personalização, além de realidade aumentada para treinamentos e fabricação aditiva, que emprega impressoras 3D para produção sob demanda.

Com tais avanços na indústria, novas possibilidades de usabilidade surgiram em diversos meios, como no meio agrícola. Tais tecnologias podem ser de grande utilidade nesta área devido a sua vastidão de variáveis, desde o terreno utilizado, tipo de planta cultivada e pragas a serem combatidas.

1.2 Objetivo

O avanço tecnológico tem transformado profundamente o setor agrícola, trazendo soluções inovadoras que aumentam a eficiência, reduzem custos e promovem práticas mais sustentáveis. Nesse contexto, o desenvolvimento de robôs agrícolas representa um marco importante na automação do campo. O projeto Agrobot, um robô projetado para executar tarefas agrícolas com precisão e autonomia, surge como uma resposta direta aos desafios enfrentados pelos produtores rurais na atualidade, como a escassez de mão de obra, o uso excessivo de insumos e a necessidade de otimização das lavouras.

Com o sucesso do desenvolvimento do Agrobot, torna-se necessário viabilizar sua produção em escala. Para isso, a construção de uma fábrica especializada é um passo estratégico essencial. Este trabalho tem como objetivo apresentar as etapas envolvidas no planejamento dessa unidade fabril, considerando aspectos como localização, layout industrial e infraestrutura necessária.

A criação de uma fábrica dedicada não apenas impulsionará a industrialização de uma tecnologia promissora, como também contribuirá para o fortalecimento da agricultura de precisão no país. Ao longo deste trabalho, será detalhado como a estrutura fabril será concebida para atender à demanda do mercado, garantir qualidade no processo produtivo e sustentar a evolução contínua do robô agrícola.

2. Processos de fabricação

A revolução industrial foi impulsionada ao longo de muitos anos pela transformação dos processos de fabricação. Desde as técnicas ancestrais e rudimentares da revolução agrícola até a tecnologia mais avançada da indústria 4.0, os processos de fabricação se têm feito presentes para gerar produtos com valor agregado. No atual momento, a eficiência e a precisão se tornaram fatores estratégicos para a competitividade das empresas no mercado globalizado.

Os processos de fabricação englobam diversos métodos e tecnologias, entre elas conformação mecânica, usinagem, fundição, soldagem, montagem, injeção de materiais e a mais recente, manufatura aditiva (Impressão 3D). Cada processo tem sua peculiaridade e aplicação específica dependendo do tipo de material, geometria da peça, escala da produção e o nível de tolerância permitido.

Desde a concepção de novas tecnologias como a automação industrial e a Internet das Coisas (IOT), os processos que envolvem a fabricação de muitos produtos passaram a ser otimizados e acompanhados em tempo real, resultando na integração entre máquinas e sensores. Esta junção tornou o controle dos processos mais simplificado, o que permitiu com que a compreensão do mesmo fosse mais eficaz.

Além dos argumentos antes apresentados, houve a necessidade de se adequar a normas e regulações implantadas, gerando novos desafios aos processos industriais. A busca constante por melhorias, culminou em uma busca por materiais recicláveis, uso racional de energia e controle de emissões de gases.

Tendo isto em mente, a necessidade de investigar de maneira mais aprofundada os processos e suas melhorias se tornou uma coisa inevitável, visto que, este conhecimento se tornou necessário para o desenvolvimento sustentável da indústria

2.1 Layout da fábrica.

Ao longo de anos, os processos industriais continuaram a crescer e evoluir, e com isso, a necessidade de estudar os métodos de montagem de uma linha de produção surgiu.

O Layout de uma fábrica pode ser definido com base em uma junção de processos isolados, ou pode se desenvolver em volta de um único produto por vez. Existem diversas formas de chegar ao resultado desejado, as mais comuns podem ser utilizadas de maneira individual ou até mesmo combinadas entre elas dependendo do produto e da empresa. Estas serão abordadas no capítulo 2.2 Tipos de layout

2.2 Tipos de Layout.

2.2.1 Layout por posição física (posicional)

Este tipo de layout funciona de maneira única, consiste na construção do processo tendo como base o produto montado, ou seja, todos os processos que envolvem a montagem são feitos ao redor do produto, mantendo-o parado enquanto o restante se organiza em sua volta.

Bons exemplos deste layout que podem ser descritos, são a fabricação de navios e Aviões. Pelo tamanho de sua construção final, qualquer tipo de mobilidade pode ser prejudicial não somente ao processo, mas ao próprio produto, então a montagem final do seu corpo é feita em um único ponto, fazendo com que as peças e máquinas se movam ao redor do corpo principal.

Apesar de ter a produção lenta, possui um valor de produto agregado alto, fazendo com que seu desenho seja mais fácil de ser confeccionado e resulte em um fácil acesso ao produto final, possibilitando mudanças no projeto de maneira mais simples.

2.2.2 Layout por processo (funcional)

Nesta modalidade, o Layout posiciona os diversos tipos de processos junto aos seus similares, formando assim setores de trabalho específicos. Sua utilização é recorrente em lugares onde se tem uma produção em alto volume de variações de peça, ou em lugares que necessitam que um cliente acesse uma área específica a um assunto, como: bancos, cartórios e supermercados.

Neste modelo há uma grande flexibilização da produção, visto que as peças não seguem um caminho linear. Algumas podem transitar em setores diferentes dependendo da sua aplicação, o que facilita a supervisão especializada de cada área.

2.2.3 Layout em linha (por produto)

Este modelo de Layout consiste numa linha de produção fixa. A posição do maquinário se torna única e sem variações, fazendo assim com que se produza apenas um tipo de produto.

Sua disposição permite uma facilidade na automatização do processo e a produção de um grande volume de produtos, porém quaisquer mudanças ou personalizações se tornam quase impossíveis de serem feitas, pois se tratam de um sistema fixo.

2.2.4 Layout celular.

Este modelo se trata de um híbrido entre o layout em linha e o funcional. Cada parte da linha se torna uma célula, que por sua vez, fica responsável pela produção de um produto específico ou uma família específica de produtos. Todas as ferramentas necessárias para o processo daquela célula funcionar ficam à disposição da linha, para dar condições para o trabalho ser executado.

Por se tratar de uma junção de métodos, suas vantagens se tornam acentuadas, pois, possibilita a redução do tempo morto no processo, redução de custo variável de produção e permite a produção em massa.

2.3 Fluxograma de processos

Antes de decidir qual o tipo de Layout mais adequado à empresa, se viu necessário montar um fluxograma dos processos já definidos em sua correta ordem, como descrito na Figura 1.

Figura 1 Fluxograma de processos

Fonte: Autoral 2025.

Após a construção do fluxograma, a visão do layout ficou mais simples, visto que, ao definir a sequência que o produto final e suas peças percorrerão,

é possível visualizar de maneira clara tanto o espaço a ser utilizado, quanto a posição dos maquinários.

Com isto em mente, o modelo mais condizente com a complexidade do processo seria o Layout em linha.

2.4 Processos utilizados.

Neste capítulo serão abordados todos os processos envolvidos na produção do robô, com o principal objetivo de se aprofundar em detalhes que antes não foram discutidos, como: características dos processos, vantagens e limitações que possam surgir ao longo do mesmo.

Muitos dos processos existentes na indústria não serão utilizados devido à estratégia make or buy, porém, os mais recorrentes se farão presentes, como: Usinagem (torneamento e fresa), corte a laser, soldagem, pintura e montagem.

2.4.1 Corte a Laser

O corte a laser é uma tecnologia muito utilizada na indústria nos dias de hoje, principalmente para o processamento de materiais em metalúrgicas e ramos automotivos. Seu funcionamento consiste em um feixe de laser altamente concentrado em um único ponto, para que possa aquecer, fundir ou vaporizar o material que se encontra neste ponto.

Como principal vantagem, este processo conta com a precisão e a repetibilidade, possibilitando assim, a produção de peças complexas e detalhadas sem a necessidade de retrabalho.

Por se tratar de um método preciso de fabricação de componentes em geral, esta será a principal forma de produção de todos os chassis que irão avançar na linha.

2.4.2 Soldagem

A soldagem é um procedimento que consiste na junção permanente entre dois materiais através da aplicação do calor, pressão ou ambos, podendo ser com a adição de material de enchimento ou não.

Dentre os diversos tipos de soldagem, os principais podem ser agrupados em três:

Soldagem por fusão: Onde as peças e o material de adição têm sua temperatura elevada acima do ponto de fusão, formando assim a poça de fusão que solidifica para formar a junção (SMAW, GMAW, GTAW).

Soldagem em estado sólido: Este método de soldagem consiste em unir peças sem fusão ou com fusão mínima. Tem como agente de junção a junção, fricção, difusão ou até mesmo a combinação de calor com a fricção.

Técnicas especiais de soldagem: São métodos de soldagem não muito convencionais, como: soldagem a laser, soldagem por feixe de elétrons, soldagem submersa e técnicas robotizadas.

2.4.3 Usinagem

A usinagem é um processo mecânico utilizado para remover o excesso de material de uma peça bruta (Tarugo ou cubo), para atingir não somente a forma desejada, como também o acabamento, juntamente com as medidas e tolerâncias impostas.

Entre os diversos métodos de usinagem que podem ser citados, apenas dois se tornam mais presentes em uma indústria: Torneamento e o Fresamento.

Torneamento: Consiste em um processo ao qual uma peça (geralmente cilíndrica) gira em torno do seu próprio eixo, enquanto a ferramenta de corte avança de maneira linear para remover o material.

Fresamento: Assim como o torneamento, o fresamento tem como objetivo remover o material da peça em questão, porém, neste método de usinagem a ferramenta de corte gira em seu próprio eixo, e a peça a ser usinada se movimenta de maneira linear.

2.4.4 Pintura

O processo de pintura é de extrema importância para o desenvolvimento do produto final dentro de uma linha de produção. Sua função não é somente estética, mas também funcional, devido a sua atuação contra corrosão, oxidação e desgaste mecânico, prolongando assim a vida útil do material.

2.4.5 Montagem

Este processo consiste em unir todos os componentes que foram criados ou comprados para o produto final. Seu principal objetivo é agregar valor por meio da junção de todas as partes antes fabricadas de maneira organizada, atendendo a todos os requisitos de tolerância e funcionalidade, fazendo com que sua produção seja feita de maneira padronizada e segura.

Nesta etapa ocorrerá a junção entre as partes mecânicas feitas na fábrica e as partes eletrônicas compradas, fazendo assim a montagem final do robô para seu pleno funcionamento.

2.4.6 Acabamento

Este processo é o último a acontecer dentro da linha de produção. Através dele, o produto pode ser embalado de modo a evitar danos ou avarias no processo de transporte, bem como avaliar visualmente qualquer defeito que possa passar despercebido nos processos anteriores.

2.4.7 Expedição

Na empresa, a expedição será encarregada de conduzir a etapa final do processo logístico, assegurando que os robôs finalizados sejam adequadamente preparados, organizados e enviados aos clientes ou centros de distribuição. As atividades incluem a verificação cuidadosa dos itens recebidos do estoque ou da produção, garantindo que as quantidades, códigos e condições físicas estejam em conformidade com os pedidos feitos. Depois de passar por essa verificação, os produtos são devidamente embalados e recebem etiquetas, notas fiscais e toda a documentação necessária para assegurar segurança, rastreabilidade e conformidade legal durante o transporte.

2.5 Layout Final

Após todos os tópicos serem determinados, o layout final da fábrica foi desenvolvido. Com o intuito de manter a linha de produção linear e bem abastecida, foi decidido que a maior parte dos insumos gerais da fábrica seriam armazenados num setor que teria fácil acesso entre todos, sendo ele o Estoque do almoxarifado citado na Figura 2.

Figura 2: Fluxo do Almoxarifado.

Fonte: Autoral 2025.

Logo após o recebimento dos materiais, as chapas de alumínio serão armazenadas na área de recebimento para permanecer de fácil acesso ao setor de corte a laser. Após as chapas serem cortadas, serão movimentadas ao setor de usinagem que por sua vez irá usinar ou soldar, conforme a necessidade.

Em seguida serão feitas as partes finais do processo de acabamento, a pintura ficará encarregada de tratar a superfície de algumas peças com tinta e logo após serão encaminhadas ao processo de montagem e acabamento.

Ambos os processos se encarregam de montar e embalar o produto final, analisando-o para perceber quaisquer erros ou defeitos que possam ocorrer ao longo do processo. Por fim chegando na expedição, ao qual será responsável por determinar os itinerários de entregas para cada local do Brasil. A figura 3 representa o caminho que a produção vai seguir.

Figura 3: Layout Final.

Fonte: Autoral 2025.

2.6 Estratégia Make or Buy

O conceito de “make or buy” (Fazer ou comprar) se baseia na necessidade de controle de uma empresa a uma peça que seja necessária para o seu produto final. Em outras palavras se baseia no questionamento do que vale a pena, se vale a pena comprar ou fazer a peça do zero.

Alguns pilares são levados em consideração para tal decisão, sendo eles os pilares qualitativos e os pilares quantitativos.

Qualitativos

- Nível de controle sobre a qualidade do produto e do processo.
- Conhecimento técnico e expertise sobre o processo produtivo.
- Flexibilidade para internalizar a produção e seu impacto sobre as operações.
- Relações de longo prazo e parcerias estratégicas.

Quantitativos

- Custo de aquisição de matéria-prima, produção, transporte, armazenagem e distribuição
- Potencial de ganhos financeiros
- Capacidade produtiva
- Capacidade dos fornecedores
- Disponibilidade de recursos como mão-de-obra, estações de trabalho, espaço físico, etc.

Dentre os pilares já citados, há também a necessidade de analisar outros fatores para esta decisão ser tomada. Há uma relação direta com custos, tecnologia e cadeia de suprimentos.

2.6.1 Custos

Para ser feita a análise do Make or Buy é necessário ter em mente os custos que ambos representam para uma empresa, bem como suas peculiaridades e necessidades.

Ao escolher o “make”, a empresa poderá aproveitar seu próprio método de fabricação, permitindo que utilize sua experiência interna e conhecimento sobre o processo do produto, o que consecutivamente ajudaria na eficiência operacional.

Em contrapartida, a empresa poderá reduzir os custos fixos ao escolher o “buy”, pois não haveria a necessidade de obter mão de obra especializada para aquela peça em específico, se concentrando somente nas suas próprias competências, podendo assim deixar a fabricação de peças que não necessitam de tanto controle a terceiros.

2.6.2 Tecnologia

Por se tratar de tecnologia, deve-se identificar se há a possibilidade de implementar novos padrões de inovação ao modelo produzido, bem como a capacidade de gerar sinergias entre as diversas peças já existentes no produto.

Ao optar pelo “buy”, é proporcionado tecnologia de ponta e atualizada ao produto final, devido aos fornecedores que são especializados naquele tipo de serviço. Outra vantagem de manter o “buy” para a parte de tecnologia é a possibilidade de se concentrar em áreas-chave de competência para produto final.

Em contrapartida, o “make” poderia proporcionar um controle maior sobre as tecnologias implantadas no produto final, bem como o seu desenvolvimento personalizado e adaptado às necessidades específicas do negócio.

2.6.3 Cadeia de suprimentos

A cadeia de suprimentos é de extrema importância para a competitividade da empresa. Tendo isto em mente, avaliar de maneira correta como o “make or buy” pode impactar de maneira geral a produção, se torna algo crucial na decisão.

Ao optar pelo “make” a produção interna vai ser envolvida, o que pode fazer com que o controle da qualidade, prazos e eficiência seja mais

abrangente, porém esta decisão também pode aumentar a complexidade e os custos no gerenciamento da produção.

Se o “buy” for escolhido a cadeia de suprimentos pode se tornar mais simples, pois reduz a necessidade de gerenciar processos de produção mais complexos, porém demanda maior esforço na seleção criteriosa de fornecedores confiáveis, e um bom relacionamento para garantir suprimentos de qualidade.

Tendo estas informações em mente, há possibilidade de encontrar o método mais eficaz de decidir quais itens serão comprados e quais serão feitos, como mostram as Figuras 4,5,6 e 7.

3. Manufatura Assistida por Computador (MAC)

A manufatura Assistida por Computador é a parte responsável pela criação de programas num ambiente virtual e controlado, tendo como base o torneamento e o fresamento CNC. Como principal programa de desenvolvimento foi utilizado o Autodesk Fusion 360, o cerne principal de construção das peças desenvolvidas e que tiveram sua programação CNC gerada através de um modelo 3D.

Duas peças foram escolhidas para serem desenvolvidas no Fusion para os processos de torneamento e fresamento CNC, sendo elas o bico aspersor e o suporte da roda do robô. As programações de ambas as peças se encontram no Apêndice 1 e 2.

3.1 Bico Aspersor

O bico aspersor representado na Figura 8, faz parte do sistema de aspersão do robô, ele é o responsável por pulverizar o defensor agrícola nas plantas quando necessário. A sua programação no Fusion foi desenvolvida entorno de cinco operações: Faceamento, Desbaste, Acabamento, Furação e Escareamento.

Figura 8: Bico Aspersor.

Fonte: Autoral

3.1.1 Torno CNC DMG CTX beta 800

Dentre muitas escolhas a serem feitas, uma das mais importantes é a escolha do maquinário ao qual será utilizado para a produção das peças, pois dependendo das suas características, pode haver alguma insatisfação no resultado final do produto. Pensando nisto, o equipamento escolhido para tal função foi o Torno dmg ctx beta 800, que se encontra representado na Figura 9.

Figura 9: Torno dmg ctx beta 800.

Fonte: Google Imagens.

Suas especificações técnicas se tornaram um ponto positivo para a sua escolha, sendo elas:

- Capacidade de usinagem: O diâmetro máximo de torneamento tem aproximadamente 500 mm no eixo X, no eixo Z é de aproximadamente 735 mm
- Ferramentas de troca: Tem um magazine de ferramentas de 20 bolsos, o que permite um setup menos demorado.

3.2 Suporte da roda

O suporte da roda representado na Figura 10, é o responsável por manter o robô estável, bem como manter a roda do mesmo no lugar correto. Sua programação no Fusion se deu através de cinco operações: desbaste, desbaste do perfil, acabamento do perfil, furação e rosqueamento. Para melhor fixação do material em sua segunda etapa de usinagem, é necessária a utilização de um suporte externo.

Figura 10: Suporte da roda.

Fonte: Autoral, 2025

3.2.1 Centro Hermle U630T

A escolha do centro de usinagem para esta peça foi de extrema importância. Suas características são essenciais para o melhor resultado da peça, visto que a mesma tem funções estruturais no robô. Sua imagem pode ser observada na Figura 11.

Figura 11: Centro de usinagem.

Fonte: Google Imagens

Suas especificações técnicas são:

- Seu eixo longitudinal tem um curso de 630 mm, o eixo transversal tem um curso de 500 mm e seu eixo vertical também tem um curso de 500 mm.
- Sua mesa de fixação tem uma área aproximada de 900mm X 528 mm, suportando até 350 Kg
- A potência do motor de fuso é variável entre 7kW e 12kW.

3.3 Folhas de processo

Após a decisão de todo o maquinário necessário para a confecção das peças, as folhas de processos se viram necessárias para manter um controle maior sobre as medidas das peças e peculiaridades que as mesmas podem sofrer ao longo do processo. As Figuras 12 e 13 representam as folhas de processos de ambas as duas peças escolhidas para cada um dos procedimentos.

Figura 12: Plano de processo do suporte da roda.

Fonte: Autoral 2025

Figura 13: Folha de processo do bico aspersor.

Fonte: Autoral 2025

3.4 Operações

Para uma boa construção e dimensionamento das peças antes citadas, pode-se observar algumas operações que foram utilizadas para a confecção das mesmas.

Neste capítulo, serão abordadas as operações e fases que cada uma das peças sofreu para dar a forma final das mesmas, e serem utilizadas no processo.

3.4.1 Faceamento

Este processo consiste na retirada do material presente na face que será usinada, geralmente é utilizado em torno mecânico. Tem como objetivo manter uma superfície plana para facilitar o acabamento e as outras operações que envolvem a face da peça. A Figura 14 demonstra como é feito o faceamento da peça.

Figura 14: Faceamento

3.4.2 Desbaste

O desbaste tem como objetivo remover o excesso de material da peça e aproximá-la de seu formato desejado, geralmente deixando uma sobra de material para ser feito o acabamento. Em ambas as peças foram necessárias esta operação, para que a forma final fosse construída, mesmo que rusticamente antes de seu acabamento. As Figuras 15 e 16 mostram como esta operação modificou as formas originais de cada uma.

Figura 15: Desbaste Bico

Figura 16: Desbaste Suporte

Fonte: Autores, 2025

3.4.3 Acabamento

O acabamento é responsável dar as dimensões exatas de cada peça, bem como a tolerância final e a qualidade superficial desejada. Esta é a ultima etapa do processo de usinagem, sendo feito com passes leves e de alta precisão. Em ambas as peças esta operação foi utilizada. No bico aspersor foi utilizado para dar acabamento à lateral da peça depois do desbaste como mostra a Figura 17. Já no suporte da roda foi utilizada para o tratamento das laterais e das faces do mesmo, como demonstra a Figura 18.

Figura 17: Acabamento Bico

Fonte: Autores, 2025

Figura 18: Acabamento Suporte

Fonte: Autores, 2025

3.4.4 Furação

Furação é um processo que consiste em fazer furos em uma peça, pode ser feito tanto em torno CNC, quanto em fresa CNC. Esta operação foi de grande importância tanto para o bico aspersor quanto para o suporte da roda, pois permitiu com que o bico tivesse a passagem para o líquido o atravessar, e também permitiu com que alguns componentes fossem conectados através dos furos feitos no suporte da roda. As Figuras 19 e 20 demonstram os furos feitos em ambas as peças.

Figura 19: Furação Bico

Fonte: Autores, 2025

Figura 20: Furação Suporte

Fonte: Autores, 2025

3.4.5 Rosqueamento

Este processo consiste na criação de uma rosca interna na peça para união de parafusos e outros elementos roscados. Esta operação foi feita exclusivamente no suporte da roda, para que pudesse garantir a fixação do mesmo no corpo principal do robô. Esta operação pode ser vista na Figura 21

Figura 21: Rosqueamento Suporte

Fonte: Autores, 2025

3.4.6 Escareamento

Este processo consiste na formação de uma cavidade cônica ou cilíndrica na boca de um furo. O escareamento foi utilizado especificamente no bico aspersor para garantir a distribuição do líquido que passará por ele. A Figura 22 demonstra esta operação.

Figura 22: Escareamento Bico

Fonte: Autores, 2025

4. Metrologia

Para assegurar a máxima performance e durabilidade do Agrobot, o seu processo de fabricação é submetido a um controle de qualidade. A missão desta etapa é validar cada fase da produção, identificando minuciosamente qualquer desvio funcional, dimensional ou visual. É certificado que cada componente de sua estrutura principal, adere estritamente às especificações do projeto. O resultado é um equipamento de alta confiabilidade, que aumenta a eficiência no campo e reduz a necessidade de retrabalho.

A precisão é a base de uma garantia de qualidade, e a metrologia é a ciência que a viabiliza. Esta área é responsável por confirmar, com exatidão matemática, que todas as peças e componentes do Agrobot estejam dentro das tolerâncias dimensionais projetadas. Utilizando um arsenal de instrumentos calibrados é garantido que a montagem seja ideal. Esse rigor no controle dimensional é o que assegura o funcionamento impecável do equipamento, sua navegação precisa e a correta execução de suas tarefas no campo.

A atuação da metrologia é estratégica e se concentra em etapas críticas, como a pós-usinagem e a pré-montagem dos componentes do Agrobot. O processo envolve análises rigorosas de lotes de produção ou, para itens de alta criticidade, a verificação de 100% das peças. Mantem-se uma interface ágil e direta com as equipes de engenharia e produção, documentando todas as inspeções em relatórios técnicos. Essa sinergia é vital para que, ao detectar qualquer não conformidade, as ações corretivas sejam implementadas de forma imediata, otimizando o fluxo produtivo.

Este controle contínuo não só eleva a qualidade do produto final, mas também contribui para a uniformidade dos processos, reduzindo o índice de retrabalho e assegurando que o Agrobot atenda aos mais altos requisitos de performance e segurança.

4.1 Rastreabilidade metrológica

A confiabilidade de cada medição realizada é sustentada pelo princípio fundamental da rastreabilidade metrológica. Para garantir essa validade, cada instrumento de medição utilizado na fabricação do Agrobot é submetido a calibrações periódicas, sempre tendo como base os padrões de referência nacionais e internacionais, como os estabelecidos pelo INMETRO. Essa cadeia ininterrupta de calibração permite que qualquer medida realizada em um componente possa ser vinculada a um padrão superior, conferindo exatidão e legitimidade a todo o processo de inspeção.

Adicionalmente, o setor de metrologia é responsável por manter um banco de dados organizado e acessível de todas as medições, uma prática que impulsiona a padronização e a melhoria contínua em nossa linha de produção. Este gerenciamento detalhado das informações garante que cada unidade do Agrobot seja montada seguindo os mesmos padrões rigorosos de precisão.

4.2 Plano de controle de qualidade

A produção interna inclui diversos componentes, que são usinados em lotes a partir de projetos criados no software Autodesk Inventor. Para cada um desses itens, a inspeção de qualidade utiliza um registro de controle dedicado. As medições são feitas com instrumentos de altíssima precisão. Apenas os componentes cujas variações se encontram estritamente dentro dos limites de tolerância recebem aprovação para seguir para a montagem.

Para assegurar a uniformidade em peças usinadas cujas tolerâncias não estão explicitadas individualmente no desenho técnico, adotou-se a norma NBR ISO 2768-1. Ela fornece uma base padrão para desvios dimensionais, angulares e de forma, garantindo a intercambialidade e a perfeita integração entre os componentes. A aplicação desta norma simplifica o projeto, previne erros de fabricação e assegura a funcionalidade e qualidade do Agrobot.

4.3 Instrumentos de medição

Para realizar o processo de medição e controle de qualidade das peças produzidas, são necessários alguns instrumentos de medição específicos. Cada um desses instrumentos também possui sua resolução a qual é calculada baseando-se nas medidas a serem analisadas, usando a seguinte fórmula: $Resolução = tolerância/10$. Abaixo a descrição desses instrumentos e suas descrições:

Figura 25: Paquímetro digital – 0,02

Fonte: Google imagens 2025

O paquímetro digital presente na Figura 25, é um instrumento de alta precisão utilizado para medir as dimensões lineares (externas, internas, profundidade e ressalto) de pequenos objetos e peças com leitura rápida e fácil, minimizando erros de interpretação.

Figura 26: Calibrador de furo P/NP

Fonte: Google imagens 2025

O calibrador de furo P/NP (Passa/Não Passa) presente na Figura 26, também conhecido como calibrador tampão liso, é um instrumento de inspeção utilizado para verificar se o diâmetro interno de um furo usinado está dentro de uma faixa de tolerância dimensional pré-determinada, sem fornecer um valor de medida específico.

Figura 27: Micrômetro externo digital – 0,001

Fonte: Google imagens 2025

O micrômetro externo digital presente na Figura 27, é um instrumento de medição de alta precisão, utilizado para aferir dimensões externas (espessura, largura, diâmetro) de peças com exatidão superior à de um paquímetro, tipicamente na faixa de milésimos de milímetro.

Figura 28: Calibrador de raio

Fonte: Google imagens 2025

Um calibrador de raios é um instrumento de medição usado para verificar o raio interno ou externo (côncavo ou convexo) de peças em ferramentarias, usinagem e controle de qualidade. Ele é tipicamente composto por um conjunto de lâminas finas de metal, com a medida do raio gravada em cada uma delas, permitindo a medição por comparação direta com a superfície da peça. O mesmo é representado na Figura 28.

4 Redes

4.1 Introdução

Nos últimos tempos, a busca pelo avanço tecnológico e pela maior eficiência processual, transformaram de forma significativa o ambiente industrial. A indústria 4.0 se caracteriza pela integração de sistemas físicos e digitais, o que a tornou dependente da comunicação entre máquinas, sensores e sistemas de controle. Desta forma as redes industriais desempenham um papel crucial, pois permite a troca de informações em tempo real entre os diversos níveis de automação, o que permite a garantia da precisão, confiabilidade e produtividade de processos.

De maneira geral, as redes industriais se desenvolveram para suprir as necessidades de um ambiente fabril ao qual redes convencionais não conseguiam atender, como o determinismo, robustez e resistência a interferências eletromagnéticas que estão presentes neste ambiente. Deste modo, diferentes tipos de padrões e protocolos surgiram, feitos para atender a diversas necessidades da comunicação industrial, como o Profibus, o Ethernet/IP e o Profinet cada um com as suas próprias peculiaridades se tratando de desempenho, arquitetura, custo e aplicação.

Dentre a diversidade de tecnologia que se dispõe no mercado, se torna essencial compreender as características técnicas, topologias e requisitos de cada rede, identificando assim a opção mais adequada para a indústria ao qual está sendo criada neste trabalho.

4.2 Protocolos de comunicação.

4.2.1 Profibus

O Profibus (Process Field Bus) foi criado em 1980 por um consórcio de empresas e instituições de pesquisa, ao qual foram lideradas pela Siemens e pela Universidade de Karlsruhe. Como principal objetivo, estabeleceu um padrão de comunicação entre controladores e dispositivos de campo de modo digital, o que possibilitou a substituição de sistemas analógicos e protocolos proprietários utilizados. Desde a sua criação, o Profibus se tornou altamente difundido no mundo inteiro, o que proporcionou a inserção do mesmo em diversos processos de automação, manufatura e controle distribuído. (Moro, 2002).

Por fazer parte da norma IEC 61158, ele é regido pelos padrões internacionais para sistemas de controle industrial. O mesmo opera no modelo mestre-escravo, onde os CLPs se comunicam com os dispositivos escravos, sendo os mais conhecidos os sensores, atuadores, inversores de frequência e módulos de entrada e saída remotos. Esta estrutura permite que o controle da rede seja determinístico, ou seja, faz com que os tempos de resposta sejam previsíveis, o que é fundamental para a aplicação em indústrias críticas. (Peres, 2012)

Existem duas vertentes deste protocolo: o Profibus-DP (Decentralized Peripherals) e o Profibus-PA (Process Automation) (Mossin, 2012)

- O Profibus-DP é voltado para a automação da manufatura e para o controle de máquinas. Ele oferece uma alta taxa de transmissão de até 12Mbps e permite a conexão de centenas de dispositivos no mesmo barramento.
- Já o Profibus-PA é mais utilizado em ambientes ao qual se vê necessária a automação dos processos, como indústrias químicas e petroquímicas. Ele também é capaz de alimentar os dispositivos conectados ao mesmo

por meio do próprio cabo de comunicação, o que faz com que opere com taxas de até 31,25 kbps, sendo certificado para áreas classificadas (à prova de explosões).

A topologia mais comum é a do barramento linear, o que permite que todos os dispositivos sejam conectados em série ao mesmo cabo de par trançado terminado em resistores de terminação nas extremidades. Existe também a possibilidade de serem utilizadas as topologias em estrela e em anel, principalmente em redes redundantes. Por causa desta flexibilidade de topologia a confiabilidade do sistema se provou real, facilitando assim a segmentação da rede conforme as necessidades da indústria. (BRANCHER, 2023)

Dentre suas principais vantagens, pode-se citar a alta confiabilidade, a sua robustez contra ruídos eletromagnéticos, e suporta a grandes distâncias entre os dispositivos, também é necessário citar que devido a consolidação desta tecnologia, há um amplo suporte técnico. Entretanto, suas limitações se tornam aparentes ao ser comparado com tecnologias modernas, como o Profinet e o Ethernet/IP, pois sua taxa de transferência é menor quando comparada os outros. (Peres, 2012).

4.2.2 Profinet

O Profinet (Process Field Network) é um protocolo de comunicação em rede para aplicações industriais que se baseia na tecnologia Ethernet, e foi desenvolvido pela mesma entidade que criou o Profibus, a Profibus & Profinet International (PI). Ele foi criado para unir a confiabilidade e o determinismo das redes de campo tradicionais (como o Profibus) com a flexibilidade, a rapidez e a integração das redes Ethernet comuns (IEEE 802.3). (SMITH, 2015).

Por isso é considerado uma das tecnologias de comunicação mais relevantes para a Indústria 4.0, pois permite a comunicação em tempo real, controle distribuído e uma integração com os sistemas de TI das empresas.

O mesmo utiliza uma estrutura de cliente e servidor, na qual um ou mais controladores (IO-Controllers), normalmente CLPs, interagem com Dispositivos (IO-Devices), como sensores, atuadores, inversores e módulos de I/O remotos. Além disso, existem os Supervisores (IO-Supervisors), que são sistemas de engenharia ou monitoramento empregados na configuração e no diagnóstico da rede. (Belíssimo, 2025)

O protocolo emprega o Common Industrial Protocol (CIP) para comunicação e é organizado em três níveis de desempenho, os quais determinam o comportamento e o tempo de resposta da rede:

- PROFINET NRT (Non-Real Time): usado para a comunicação de dados não críticos, como configuração e diagnóstico, sobre o TCP/IP.
- PROFINET RT (Tempo Real): utilizado em contextos em que a comunicação em tempo real é essencial, como no gerenciamento de processos e sincronização simples, com intervalos que variam de 1 a 10 ms.
- PROFINET IRT (Isochronous Real Time): voltado para aplicações de controle de movimento (motion control), com ciclos inferiores a 1 ms e comunicação previsível garantida por meio de mecanismos de agendamento e sincronização de clock (IEEE 1588).

Devido à sua estrutura modular, o PROFINET pode ser utilizado em aplicações simples, bem como em sistemas sofisticados de automação, como robôs industriais e linhas de montagem automatizadas. (SMITH, 2015)

As topologias possíveis incluem estrela, linha, anel (com redundância MRP - Media Redundancy Protocol) e árvore, o que permite expandir e aumentar a confiabilidade do sistema. Além de utilizar cabo de par trançado ou fibra óptica, o que o faz atingir velocidades de 100 Mbps a 1 Gbps (Belíssimo, 2025).

O MRP permite a restauração automática da comunicação em milissegundos em caso de falha em um segmento de rede, garantindo a alta disponibilidade dos sistemas industriais.

4.2.3 Ethernet/IP

O Ethernet/IP (Ethernet Industrial Protocol) foi criado no final dos anos 1990 pela empresa Allen-Bradley, que hoje faz parte da Rockwell Automation nos Estados Unidos. Seu objetivo inicial foi ajustar a tecnologia Ethernet, comumente empregada em redes empresariais, para o contexto industrial, que exige maior resistência, confiabilidade e comunicação em tempo real. A ODVA (Open DeviceNet Vendors Association) liderou o desenvolvimento e a padronização do protocolo em 2001, e essa organização ainda é responsável pela gestão de suas especificações e atualizações (ODVA, 2023).

O Ethernet/IP é um protocolo de comunicação industrial baseado nos padrões TCP/IP e UDP/IP, permitindo a conexão direta entre as redes de Tecnologia da Informação (TI) e Tecnologia de Automação (TA). Ele utiliza o modelo CIP (Common Industrial Protocol), que define a estrutura de comunicação e os serviços necessários para a troca de informações entre dispositivos industriais, como CLPs (Controladores Lógicos Programáveis), sensores, atuadores e inversores de frequência (Rockwell Automation, 2022).

Na Indústria 4.0, o Ethernet/IP é fundamental, pois proporciona a conectividade e a habilidade de interoperabilidade entre máquinas, sistemas e dispositivos inteligentes. Essa integração permite a coleta e análise de dados em tempo real, o monitoramento remoto de processos e a conexão com sistemas em nuvem, o que melhora a eficiência, a rastreabilidade e a automação. Por ser baseado no padrão Ethernet, o protocolo facilita a interoperabilidade entre aparelhos de diferentes fabricantes, reduzindo custos e simplificando a manutenção das redes industriais (Silva & Pereira, 2021). Em resumo, o Ethernet/IP representa a integração das redes corporativas e sistemas industriais, sendo uma tecnologia essencial para a digitalização, automação e conectividade que caracterizam a Indústria 4.0.

A topologia proposta para a rede de fábrica baseada em Ethernet/IP segue um modelo estruturado, dividido em camadas para garantir organização, segurança, desempenho e facilidade de expansão. Ela integra elementos de Tecnologia da Automação (TA) e Tecnologia da Informação (TI), mantendo comunicação eficiente entre dispositivos industriais e sistemas corporativos.

1°. Camada Corporativa (TI)

- Servidores de Gestão e Análise: Localizados no data center da empresa, incluem servidores de supervisão (SCADA), bancos de dados, ERP/MES e serviços em nuvem.
- Switch Core da TI: Conecta todos os setores administrativos e faz a ligação controlada com a rede industrial.
- Firewall TI–TA: Faz a separação entre o ambiente corporativo e o ambiente industrial, aplicando regras de controle de acesso, logs e inspeção de pacotes.

2°. Camada de Controle (TA – Automação)

- Switch Gerenciado Industrial: Instalado próximo às máquinas, preparado para ambientes agressivos e com suporte a protocolos como CIP e QoS para tráfego determinístico.
- CLPs (Controladores Lógicos Programáveis): São os principais responsáveis pela automação dos processos. Utilizam Ethernet/IP para trocar dados com sensores, atuadores e sistemas supervisórios.
- Painéis de IHM (Interface Homem-Máquina): Conectados ao switch industrial, recebem e enviam dados em tempo real usando Ethernet/IP para visualização e comandos.

3°. Camada de Dispositivos de Campo

- Sensores e Atuadores Inteligentes: Equipamentos que se comunicam diretamente via Ethernet/IP ou por módulos remotos de I/O.
- Módulos de I/O Remoto (Rack I/O): Conectados ao CLP através de Ethernet/IP, permitindo leitura e acionamento de pontos distribuídos pela máquina ou processo.
- Inversores de Frequência e Controladores de Motor: Também utilizam Ethernet/IP para enviar diagnósticos, parâmetros e status.

4.4 Protocolo escolhido

Para a escolha do protocolo mais condizente com a estrutura da fábrica, foi necessário fazer um comparativo entre os três citados nos capítulos 4.2.1, 4.2.2 e 4.2.3, devido a tal necessidade, foi montado a tabela descrita na Figura 29.

Figura 29: Comparação entre os protocolos.

Características	PROFIBUS	PROFINET	Ethernet/IP
Tipo de comunicação	Serial (RS-485 ou fibra óptica)	Ethernet industrial	Ethernet industrial
Taxa de transmissão	Até 12 Mbps	100 Mbps a 1 Gbps	10/100/1000 Mbps
Padrão físico	RS-485 dedicado	IEEE 802.3 (Ethernet)	IEEE 802.3 (Ethernet)
Topologia típica	Linha (bus)	Linha, estrela ou anel	Estrela, linha ou anel
Protocolo base	Proprietário Siemens / PI	Industrial Ethernet (PI)	CIP (Common Industrial Protocol – ODVA)
Determinismo (tempo real)	Alto (ciclos fixos)	Muito alto (RT e IRT)	Médio a alto (depende da configuração)
Integração com redes de TI	Limitada	Excelente	Excelente
Diagnóstico e manutenção	Simples e local	Avançado e integrado	Avançado e distribuído
Custo de implementação	Médio	Médio a alto	Médio
Compatibilidade de equipamentos	Ampla em sistemas legados (Siemens, ABB, etc.)	Total com sistemas modernos Siemens / WEG / Schneider	Ampla (Rockwell, Omron, Schneider, etc.)
Nível de maturidade tecnológica	Consolidado (em declínio)	Atual e em expansão	Atual e consolidado
Adequação para Indústria 4.0	Limitada	Totalmente compatível	Altamente compatível

Fonte: Autores, 2025

Em uma breve comparação, pôde-se perceber que o protocolo Profinet se provou o mais completo dentre os três, embora seu custo seja mais alto que o dos outros, sua compatibilidade e desempenho se tornaram o alvo ao qual a rede da fábrica almeja. Sua confiabilidade também se tornou um ponto muito concreto.

4.5 Topologia

A topologia de uma rede é de extrema importância para a empresa, pois determina a maneira ao qual a mesma se desenvolverá ao longo do tempo, e a maneira que se comportará em meio as adversidades enfrentadas no meio do caminho.

Dentre as diversas topologias existentes ao qual o profinet suporta (estrela, linha, arvore e anel), a que se destacou foi a estrela. Embora seja arriscado devido as conexões estarem concentradas em um switch principal, há também pontos fortes neste tipo de rede, sendo eles: Facilidade de integração, alta escalabilidade, manutenção simplificada e a facilidade de gerenciamento.

4.6 Arquitetura de rede

4.6.1 Zona desmilitarizada (DMZ)

A DMZ (Zona desmilitarizada), nada mais é do que uma parte da rede projetada para atuar como um buffer e ajudar na camada de segurança entre uma rede que não é confiável, como a internet, e uma rede privada e critica (rede fabril). Seu princípio de funcionamento consiste no isolamento de risco externo, pois protege a rede interna de acessos indesejados, e se caso for de fato invadida consegue conte-la na DMZ não permitido a passagem para o restante da rede. A Figura 30 demonstra como a DMZ foi montada.

Figura 30: Zona desmilitarizada.

Fonte: Autores, 2025

É possível ver que nesta área está o servidor web interno. Sua localização foi disposta desta maneira devido a segurança que a DMZ proporciona, fazendo um intermédio entre as informações externas e as informações internas da fábrica.

O Switch tem a finalidade de direcionar as informações que entram e saem do servidor e da Internet, dando mais controle ao processo.

4.6.2 Rede Interna

A rede interna é composta por dispositivos não industriais, ou seja, ela será direcionada a fins administrativos como estações de trabalho e impressoras. Sua interligação será feita através de um switch interno, que fará a ligação entre todos os endpoints.

O acesso a DMZ via rede interna será rigidamente controlado através de um firewall interno, que vai atuar como uma barreira, segmentando as informações que irão trafegar e ajudando a controlar invasões que possam ocorrer. A Figura 31 mostra de maneira visual o que foi dito.

Figura 31: Rede interna.

Fonte: Autores, 2025

4.6.3 Rede OT (Tecnologia Operacional)

A rede OT é o centro da automação da indústria. Ela é responsável pela coleta de informações dos produtos que percorrem a produção. Está isolada da DMZ através de um gateway de segurança que realiza o controle de alguns protocolos industriais específicos. A figura 32 descreve de forma visual o como esta rede foi organizada.

Figura 32: Rede OT.

Fonte: Autores, 2025

Nesta rede estão conectados todos os dispositivos da automação da fábrica, muitos destes dispositivos são amplamente utilizados para garantir um controle mais abrangente da produção, sendo eles:

Servidor OT: é responsável pelo gerenciamento dos componentes ativos da rede, como CLPs (Controlador Lógico Programável) e máquinas industriais.

Sensores: São responsáveis pela coleta de informações na linha de produção. Estas informações são enviadas ao sistema via esp32.

Esp32: É o ponto de entrada das informações coletadas pelos sensores. Estas informações são enviadas através do protocolo MQTT para o servidor OT.

Switch: Este equipamento é o responsável por interligar os componentes que estão na linha de produção, sendo eles CLPs, maquinários e o computador com o Esp32

Gateway: O gateway apresentado na Figura 32 será o responsável por mais uma camada de proteção da rede OT, fazendo com que a integridade dos dados seja mantida e protegida.

Para compreender a rede num todo foi montada a Figura 33, que representa a topologia e a disposição das conexões dos dispositivos com o switch central de cada área.

Figura 33: Topologia completa.

5. IOT (Internet of Things)

5.1 Resumo

A Internet das Coisas (IoT) simboliza uma revolução tecnológica que combina sensores, dispositivos e sistemas de análise para converter dados em valor. Essa tecnologia tem se destacado como uma ferramenta fundamental para monitoramento em tempo real, manutenção preditiva e otimização de processos no setor industrial. Este estudo demonstra uma aplicação prática da IoT em um processo de produção, abrangendo desde a seleção dos dispositivos até a análise de dados e a sugestão de soluções inovadoras.

5.2 Introdução

A Indústria 4.0, que representa a digitalização do setor industrial, é impulsionada por tecnologias emergentes, como inteligência artificial, computação em nuvem e, sobretudo, Internet das Coisas. Essa integração cria ambientes produtivos inteligentes, nos quais os dados em tempo real são empregados para aprimorar a produção, minimizar erros e aumentar a eficiência.

Nesse cenário, a IoT deixa de ser uma simples tendência e se torna uma necessidade estratégica para as empresas que almejam competitividade e inovação. Este estudo tem como objetivo mostrar como a IoT pode ser utilizada em processos produtivos reais, empregando dispositivos acessíveis e plataformas de análise de dados, sugerindo melhorias fundamentadas em evidências concretas.

5.3 Fundamentação Teórica

5.3.1 Conceito de IoT

A Internet das Coisas (IoT), sigla em inglês para Internet of Things, é caracterizada como um modelo tecnológico que amplia a conectividade da Internet para objetos físicos e aparelhos do dia a dia. Seu objetivo principal é possibilitar a interação entre essas "coisas", permitindo a coleta, troca e análise de dados em tempo real, sem a necessidade de intervenção humana direta. O conceito se estende além da comunicação convencional entre indivíduos (P2P - person-to-person) ou entre indivíduos e máquinas (P2M - person-to-machine), concentrando-se principalmente na comunicação entre máquinas (M2M - machine-to-machine).

Aspectos fundamentais da IoT:

- **Ubiquidade e Pervasividade:** Os aparelhos estão presentes em todos os lugares, formando um ambiente de computação ubíqua (onipresente), no qual a tecnologia está integrada ao ambiente e se torna imperceptível.
- **Inteligência Embarcada:** As "coisas" (objetos) são dotadas de capacidade de sensoriamento, processamento e comunicação, tornando-se objetos inteligentes.
- **Geração de Dados Massivos (Big Data):** A interconexão gera um volume extraordinário de dados, que são a matéria-prima para a inteligência e a automação do sistema.

Basicamente, a IoT transforma o mundo físico em um vasto sistema de informações, onde os objetos se tornam fontes de dados capazes de informar e, em muitos casos, agir autonomamente sobre o ambiente.

Componentes da IoT:

Esta é a camada física, o ponto de contato direto com o mundo real, onde temos os sensores, atuadores e os dispositivos.

Sensores: São os "olhos e ouvidos" do sistema IoT. Eles detectam e coletam dados do ambiente físico (ex: temperatura, pressão, umidade, vibração, movimento, luz). Os sensores transformam variáveis físicas em sinais elétricos ou digitais, que serão analisados pelo sistema e por microcontroladores para determinar como agir nesse meio utilizando os atuadores.

Atuadores: São os dispositivos de saída, os "músculos" da IoT. Recebem comandos do sistema de controle e executam ações no ambiente físico (ex: ligar/desligar uma luz, ajustar um termostato, abrir uma válvula, acionar um motor).

Dispositivos de Borda (Edge Devices): São as próprias "coisas" (ex: câmeras de segurança, medidores inteligentes, veículos conectados). Eles incorporam o sensor/atuator, um microcontrolador (o "cérebro" para processamento local) e um módulo de comunicação.

5.3.2 Indústria 4.0 e IoT

A Indústria 4.0 e a Internet das Coisas estão intrinsecamente ligadas, já que a IoT é a tecnologia fundamental que habilita a Indústria 4.0 sendo um dos pilares dela. Elas representam a Quarta Revolução Industrial, caracterizada pela transformação digital completa da manufatura.

Na Indústria 4.0 há a digitalização e a interconexão de todos os ativos, processos e pessoas na produção, criando "fábricas inteligentes"., em conjunto é o resultado da aplicação da IoT e de outras tecnologias digitais na indústria.

IoT é a tecnologia-chave que permite conectar máquinas, sensores e sistemas via internet, habilitando-os a coletar e trocar dados em tempo real., em conjunto é o meio que fornece a conectividade e os dados essenciais para que a Indústria 4.0 funcione.

Em essência, a IoT fornece os dados (através de sensores e dispositivos conectados) e a conectividade (a rede) no chão de fábrica, já a Indústria 4.0 utiliza esses dados e essa conectividade, combinando-os com tecnologias como a Inteligência Artificial (IA) e o Cloud Computing, para analisar e automatizar as decisões de produção, otimizando todo o ciclo de vida do produto e da operação.

A união dessas duas forças cria um ecossistema de produção ciberfísico que permite a manutenção preditiva, a personalização em massa, e a otimização em tempo real.

5.3.3 Análise de Dados e Tomada de Decisão

A coleta de dados simples não é suficiente. A informação adquire valor na análise, convertendo-se em insights práticos que asseguram decisões fundamentadas em evidências robustas. Para esse fim, o mercado emprega uma variedade de ferramentas especializadas:

- Power BI e Tableau são fundamentais para a Inteligência de Negócios (BI), proporcionando visualizações detalhadas para a análise de dados empresariais e painéis executivos.
- A análise é elevada a um novo patamar com o Machine Learning, que possibilita a automação de previsões, como a detecção precoce de falhas (manutenção preditiva) e a otimização inteligente de recursos.

5.4 Metodologia

Este estudo utiliza uma abordagem metodológica aplicada, voltada para a resolução prática de questões operacionais e para a melhoria da eficiência produtiva por meio da incorporação da Internet das Coisas. O processo de desenvolvimento e implementação seguiu um ciclo rigoroso de cinco fases sequenciais:

- **Seleção e Definição Técnica de Hardware:** Seleção cuidadosa dos sensores e dispositivos IoT, levando em conta a natureza dos dados a serem coletados, a precisão requerida e a compatibilidade com os protocolos de comunicação industrial do ambiente de fábrica.
- **Implementação do Sistema de Captação e Transmissão de Dados:** Montagem física dos sensores e ajuste dos gateways ou CLPs. A infraestrutura de rede é configurada para garantir a coleta e transmissão constantes e seguras dos dados operacionais ao sistema central.
- **Armazenamento, Processamento e Visualização de Dados:** Direcionamento dos dados brutos para um banco de dados otimizado (Time-Series) e sua posterior exibição em um Painel de Controle (Dashboard). Esta etapa utiliza software para apresentar métricas-chave como a Eficácia Global do Equipamento (OEE) em tempo real.
- **Análise de Dados e Diagnóstico de Ineficiências:** Utilização dos dados coletados para realizar uma análise estatística aprofundada, buscando identificar padrões, variações anômalas e a causa raiz dos problemas (gargalos e falhas) que não são visíveis sem a monitorização contínua.

- **Proposição e Validação de Melhorias Data-Driven:** Elaboração de ações de melhoria estimáveis (ajustes de parâmetros, otimização da manutenção preditiva) com base estrita no diagnóstico. O trabalho é concluído com a implementação piloto dessas melhorias, validando o retorno prático da solução IoT.

5.5 Ferramentas, Softwares e Dispositivos Utilizados

A solução de monitoramento industrial foi construída através de uma arquitetura que integra hardware, software e protocolos de comunicação, selecionados com base em critérios de baixo custo, escalabilidade, robustez e eficiência em tempo real.

5.5.1 Dispositivos de Aquisição e Borda (Edge Devices)

Os componentes de hardware são responsáveis pela coleta direta dos dados no ambiente de fábrica e pelo seu pré-processamento, constituindo a camada de borda do sistema.

ESP32: Atua como o principal Microcontrolador com conectividade Wi-Fi e Bluetooth integrada. Foi escolhido por seu poder de processamento Dual Core, baixo consumo de energia e por ser ideal para a leitura simultânea de múltiplos sensores, pré-processamento de dados e transmissão eficiente via protocolo MQTT (Message Queuing Telemetry Transport).

Sensor Indutivo: Essencial para o monitoramento de posição e contagem de peças metálicas em linhas de produção e esteiras transportadoras.

Sensor Óptico: Utilizado para a contagem e detecção de objetos não metálicos ou para verificar o posicionamento preciso de componentes. É fundamental para monitorar a presença/ausência de embalagens, rótulos ou produtos, contribuindo diretamente para o cálculo da taxa de rejeição e do throughput (rendimento).

Sensor Capacitivo: Implementado para a detecção e monitoramento de materiais não metálicos em contato direto. É crucial para identificar o limite mínimo ou máximo de insumos e matérias-primas na linha, prevenindo paradas por falta de material.

5.5.2 Softwares e Protocolos de Comunicação

Node-RED: É a plataforma visual de programação de fluxos IoT (middleware). Foi empregado para receber as mensagens MQTT, aplicar regras de negócio e rotear os dados limpos para o banco de dados, agilizando o desenvolvimento com sua interface baseada em nós.

MQTT: Protocolo de comunicação padrão da indústria IoT. Foi escolhido por ser extremamente leve, eficiente em largura de banda limitada e por utilizar um modelo de publicação/assinatura, garantindo a transmissão de dados confiável dos sensores ao broker.

5.5.3 Linguagens e Frameworks de Desenvolvimento

C/C++ (via Arduino IDE): Utilizado para o desenvolvimento do Firmware de baixo nível do ESP32, garantindo a máxima eficiência e otimização de memória na leitura de sensores e na interface com o protocolo MQTT.

JavaScript: Utilizado no ambiente Node-RED para a criação de funções personalizadas e a manipulação dos pacotes de dados no formato JSON.

Bibliotecas MQTT: Frameworks leves implementados no ESP32 para facilitar a codificação eficiente das rotinas de conexão Wi-Fi e a gestão da comunicação via protocolo MQTT.

5.6 Implementação da IOT

A fase de implementação irá transformar o projeto teórico em um sistema funcional, utilizando a metodologia proof-of-concept (prova de conceito) em um ambiente controlado para validar a arquitetura proposta.

5.6.1 Cenário Simulado e Variáveis de Monitoramento

5.6.1.1 Ambiente da produção

Para simular um ambiente industrial relevante, na parte da produção foi estabelecido um cenário simulado de uma pequena célula, composta por três (3) máquinas operacionais (M1, M2 e M3) configuradas para funcionar em um ciclo contínuo. Este layout permitiu a coleta de dados de forma distribuída, replicando um ambiente fabril real.

As variáveis operacionais monitoradas, cruciais para o cálculo da performance e para a estratégia de Manutenção Preditiva, foram, contagem e posição com a Inclusão de sensores de proximidade para simular a contagem do throughput (peças/ciclos).

Os sensores utilizados foram: Sensor de Proximidade Indutivo IME18-08BPSZC0S 1040966 Sick, Sensor de Proximidade Capacitivo CM18-08BPP-KC1 Sick e o Sensor Fotoelétrico (Óptico) VI1802P42431 Sick. Os três podem ser demonstrados nas Figuras 34, 35 e 36.

Figura 34: Sensor de Proximidade Indutivo.

Fonte: Google imagens 2025

Figura 35: Sensor Capacitivo

Fonte: Google imagens 2025

Figura 36: Sensor Óptico

Fonte: Google imagens 2025

5.6.1.2 Ambiente do Almojarifado

Já no monitoramento ambiental para um almojarifado o foco da implementação foi para rastrear e alertar sobre as condições críticas tanto de temperatura quanto em relação a umidade do setor, pois afetam diretamente o estoque. O sensor utilizado foi o Módulo DHT22 Sensor De Umidade e Temperatura demonstrado na Figura 37.

Figura 37: Sensor de Umidade e Temperatura

Fonte: Google imagens 2025

5.6.2 Arquitetura de Implementação e Fluxo de Dados

A infraestrutura de monitoramento será implementada seguindo a arquitetura Edge-to-Cloud (ou Edge-to-Local Server), garantindo a integridade e a baixa latência na transmissão de dados:

Instalação Física e Aquisição de Dados: Os sensores serão instalados nas esteiras, cada um em uma linha de produção das respectivas peças: carcaça, suporte e bico aspersor, com o intuito de realizar a contagem de cada peça. O ESP32 foi configurado como o módulo de aquisição de borda (Edge Device), responsável por ler os dados analógicos e digitais dos sensores.

Comunicação Via MQTT: Após a leitura e o pré-processamento, o firmware do ESP32 foi programado para encapsular os dados em mensagens JSON e enviá-las de forma otimizada utilizando o Protocolo MQTT. O modelo Publisher/Subscriber assegurou a eficiência de banda e a transmissão confiável para o Broker (servidor de mensagens).

Middleware e Armazenamento: O Node-RED foi configurado para atuar como o middleware do sistema. Ele recebe as mensagens MQTT do Broker, aplica as regras de parsing e roteamento, e, por fim, encaminha os dados formatados para o dashboard do próprio software.

5.6.3 Fluxo da Produção

Neste ambiente da parte da produção o objetivo é simular a entrada dos diferentes tipos de peças fabricados (Carcaça, Suporte e Bico aspersor) que serão detectadas com a implementação dos sensores indutivo, capacitivo e óptico, respectivamente para cada tipo de peça.

O fluxo começa com um nó MQTT in configurado com o tópico “Producao”, este nó é o ponto de entrada para os seguintes comandos:

I – Simula a detecção da peça Carcaça, por um sensor indutivo;

C – Simula a detecção da peça Suporte, por um sensor capacitivo;

O – Simula a detecção da peça Bico, por um sensor óptico;

RI – Comando para resetar o contador da Carcaça;

RC – Comando para resetar o contador do Suporte;

RO – Comando para resetar o contador do Bico;

Qualquer outro valor é tratado como rejeito/peça desconhecida;

O nó Switch chamado de seletor de função direciona a mensagem para o processamento/contagem ou para o reset correspondente ao valor da mensagem recebida.

- Contagem e Processamento das peças: Cada peça tem um nó function dedicado que acessa e incrementa uma variável global, (ex: `Global.set('Contador_carcaca')`) cria uma mensagem contendo o destino da peça (Esteira 1, Esteira 2 ou Esteira 3) e o contador atual da peça correspondente. Após a contagem a mensagem é enviada para o nó MQTT out configurado para o tópico “Supervisao” e para o nó Debug para fins de haver um log detalhado.
- Reset dos Contadores: Os comandos de reset são direcionados para os nós functions que zeram os respectivos contadores da variável global (ex: RI zera ‘Contador_carcaca’), após o reset uma mensagem é enviada para o nó MQTT out também configurado no tópico “Supervisão” e para o nó Debug “feedback reset”.

A Figura 38 representa o fluxo de programação da produção.

Figura 38: Fluxo da programação da produção.

Fonte: Autores, 2025

5.6.4 Dashboard da Produção

Este dashboard fornece a interface para visualização da contagem das peças e alertas, além de possuir botões para simular os sensores para fins de testes, os nós “ui-button” permitem esta simulação enviando os comandos (I, C, O, RI, RC, RO) diretamente aos nós function correspondentes a contagem ou reset.

Um fluxo independente que é gerenciado pelo nó inject que a cada 0.5 segundos atualiza o dashboard e realiza a função de buscar os valores dos contadores da carcaça, suporte e bico e os transforma em mensagens numéricas para que os nós “ui-gauge” possam apresentar esta mensagem de forma visual no dashboard.

Neste fluxo também é emitido os alertas de que as caixas das peças estão cheias baseadas nos valores da contagem e limites máximos definidos nos ui-gauges, quando o limite é atingido o nó “ui-notification” exibe uma mensagem de alerta no dashboard. A Figura 39 Mostra o dashboard da produção.

Figura 39: Dashboard da Produção

Fonte: Autores, 2025

5.6.5 Fluxo do Almojarifado

No monitoramento ambiental da parte do almojarifado é realizada a obtenção dos dados de Temperatura e Umidade dele, pois afetam diretamente a qualidade do estoque. O projeto também utiliza o protocolo MQTT para receber dados do sensor e um dashboard para visualização em tempo real e emitir alertas de situações críticas.

O fluxo começa com um nó MQTT in configurado para escutar o tópico “Almojarifado” e receber dados do sensor, após isso a uma separação dos dados onde o nó Switch chamado de “Seletor de Função”, direciona a mensagem com base no valor recebido, isso é crucial para diferenciar a temperatura (saída 1 e 2) da umidade (saída 3). O fluxo do almojarifado é representado pela Figura 40.

Figura 40: Fluxo da programação do almoxarifado

Fonte: Autores, 2025

Temperatura: A mensagem é enviada para as saídas 1 ou 2 se no valor recebido contenha a letra C maiúscula ou minúscula, respectivamente, representando Celsius, após isso a mensagem é direcionada para o nó Change onde é retirado o caractere “C” da mensagem para somente valores numéricos, depois o valor chega ao nó ui-gauge1 que por sua vez fará com que ele seja visível no dashboard.

O nó function receberá os valores contidos no ui-gauge1, onde será feita uma conversão deste valor para uma mensagem que contenha o valor da temperatura após o texto: “Temperatura:” enviando assim para um nó MQTT out configurado com o tópico “Supervisao”.

A temperatura ideal para o ambiente é entre 18°C e 25°C, abaixo de 18°C é considerado frio, através do nó Switch que também recebe os valores contidos no ui-gauge1, serão identificadas temperaturas acima de 25°C até 40°C emitindo um alerta pela saída 1 através do nó ui-notification onde aparecerá uma mensagem de temperatura irregular, após os 40°C o alerta também será acionado pela saída 2 chegando ao nó ui-notification, mostrando uma mensagem no dashboard de temperatura crítica.

Umidade: Na saída 3 do seletor de função do fluxo do almoxarifado o valor recebido é direcionado para o nó ui-gauge2 que exibirá os valores em porcentagem onde:

Umidade Baixa – valor até 40%;

Umidade Ideal – Entre 40% e 70%;

Umidade Alta – Acima de 70%;

Estes valores irão para os nós Switch e Function, o nó function irá converter esta mensagem para o valor numérico da umidade após o texto: “Umidade:”, e direcionar para o nó MQTT out com tópico de “Supervisao”. Já o nó Switch irá verificar se o valor estiver abaixo de 40% e emitir um alerta através do nó ui-notification com uma mensagem no dashboard de Umidade Baixa, se o valor estiver acima de 70%, também emitirá um alerta com a mensagem de Umidade Alta. O dashboard do almoxarifado pode ser mostrado na Figura 41.

Figura 41: *Dashboard Almoxarifado*

Fonte: Autores, 2025

6 Segurança Cibernética

6.1 Introdução aos temas abordados

Nesta matéria será abordado sobre a segurança cibernética da fábrica, os temas abordados na matéria serão: como será aplicado as normas de segurança em redes de Manufatura industriais, o conhecimento sobre os pilares da segurança da informação, aplicação das políticas de segurança da informação, conhecer os principais protocolos de SI e as suas características e como será aplicado os conceitos de senhas com MFA, firewall, criptografia, políticas de segurança e outros mecanismos de segurança que podem ser aplicados ao projeto.

6.2 Aplicando as Normas de Segurança em Redes de Manufatura Industriais.

As normas de segurança para a industrial são um conjunto de regras e procedimentos obrigatórios criados pelo governo para garantir a segurança e saúde dos trabalhadores em seu ambiente de trabalho. Já as normas de segurança em redes de manufatura industriais são para lidar com o risco mais moderno e complexo que é a Cibersegurança industrial.

Enquanto, as normas de segurança tradicionais têm o foco proteger o corpo físico do trabalhador, as normas de rede focam em proteger os sistemas que controlam essas máquinas e processos. O foco das normas para a rede de manufatura industriais é sempre impedir que uma falha ou ataque cibernético cause um impacto físico na operação ou nos trabalhadores.

Para a criação de uma boa segurança para a rede da fábrica, serão necessários seguir normas e padrões que são elaboradas por organizações internacionais e nacionais de padronização, sendo elas:

- International Electrotechnical Commission (IEC), que é responsável pela IEC 62443, que é a referência mundial em segurança para sistemas de automação e controle industrial.

- International Organization for Standardization (ISO), onde junto com a IEC, publica normas como a ISO/IEC 27001 para a gestão de segurança da informação
- National Institute of Standards and Technology – EUA (NIST), que publica o Cybersecurity Framework e guias técnicos de boas práticas.
- International Society of Automation (ISA), onde criou inicialmente o padrão ISA-99, que evoluiu para a série IEC 62443.

Já no Brasil essas normas são oficializadas e adaptadas, pelos órgãos:

- Associação Brasileira de Normas Técnicas (ABNT), é o órgão principal pois é quem traduz/adota as normas internacionais, como ISO e IEC, e cria normas nacionais quando necessário.
- Autoridade Nacional de Proteção de Dados (ANPD), que é ligada à LGPD, que também impacta a proteção de informações industriais e pessoais.
- Ministério do Trabalho e Emprego, responsável pelas Normas Regulamentadoras (NRs), como a NR-12, que embora foque na segurança de máquinas, se conecta à automação.

Em resumo as normas e padrões se vêm principalmente da IEC, ISO, NIST e ISA, e no Brasil quem oficializa ou adapta é a ABNT, junto de órgãos reguladores.

6.2.2 Sabendo por quem, as normas, são elaboradas e padronizadas.

As normas para rede de manufatura industriais que vão ser adotadas para a fábrica são:

IEC 62443, será o padrão central para a indústria, onde suas funções é:

- Ser a principal norma para sistemas de automação e controle industrial.

- Divide Responsabilidades entre fabricantes dos equipamentos, integrador de sistemas e usuário final.
- Define requisitos como segmentação de rede entre TI (Administrativo) e OT (produção/robôs), controle de acesso por níveis de privilégio e monitoramento e resposta a incidentes industriais.

Em essência, a IEC 62443 oferece uma abordagem abrangente a segurança cibernética, abordando não apenas aspectos técnicos, mas também questões organizacionais e processuais. Ela abrange desde a avaliação de riscos e o projeto de sistemas até a respostas e recuperação de incidentes, fornecendo um roteiro para que as organizações estabeleçam uma postura de segurança cibernética robusta e resiliente em suas operações industriais. (Oni, 2023)

ISO/IEC 27001, onde é a gestão da segurança da informação, sendo suas funções serem:

- Voltada para a proteção da informação como documentos, dados de projeto do robô e propriedade intelectual.
- Estabelece políticas de segurança, gestão de riscos, análise de vulnerabilidade e auditorias.

A norma ISO 27001 garante práticas mais eficazes de segurança da informação. Com isso, todos os dados sensíveis da organização se tornam mais seguros, reduzindo as chances de golpes ou roubo de informações. A certificação também garante a conformidade do negócio com as legislações vigentes, como a LGPD. (Serasa, 2024)

NR-12, uma norma Brasileira voltada para segurança em máquinas e equipamentos, onde suas funções são:

- Exigir cuidados na automação, mas é mais voltada para a segurança física.
- Relaciona-se com barreiras físicas, sensores de parada de emergência e sistemas de proteção integrados.

A função da NR-12 é definir referências técnicas, princípios fundamentais e medidas de proteção para resguardar a saúde e a integridade física dos trabalhadores,

além de estabelecer requisitos mínimos para a prevenção de acidentes e doenças do trabalho. (Nederman, 2022)

LGPD, é uma lei geral de proteção de dados do Brasil, que é:

- Se a fábrica coleta dados de clientes ou colaboradores, deve garantir que o tratamento esteja de acordo com a lei.

Foi promulgada para proteger os direitos fundamentais de liberdade e de privacidade, e a livre formação da personalidade de cada indivíduo. A Lei fala sobre o tratamento de dados pessoais dispostos em meio físico ou digital, feito por pessoa física ou jurídica de direito público ou privado, englobando um amplo conjunto de operações que podem ocorrer em meios manuais ou digitais. (Gov, 2024)

NIST Cybersecurity Framework, é um guia que ajuda a montar um plano de cibersegurança aplicável tanto em TI quanto OT, sendo:

- Um guia prático com 5 pilares: Identificar, Proteger, Detectar, Responder e Recuperar.

O NIST CSF foi projetado para ser flexível o suficiente para se integrar aos processos de segurança existentes em qualquer organização, em qualquer setor. Ele fornece um excelente ponto de partida para implementar segurança da informação e gerenciamento de riscos de segurança cibernética em praticamente qualquer organização do setor privado nos Estados Unidos. (IBM, 2024)

Adotando essas normas para a rede se garante tanto a continuidade da produção e segurança dos trabalhadores, caso aja um ataque cibernético, quanto a proteção dos dados e da propriedade intelectual da fábrica ou clientes.

6.3 Os Pilares da Segurança da Informação.

Os pilares da segurança da informação são princípios de boa prática para a segurança da rede de uma organização. No início em 1977, foram sugeridos pelo Instituto Nacional de Padrões e Tecnologia (NIST) dos Estados Unidos. A proposta dos 3 primeiros pilares, que são Confidencialidade, Integridade e Disponibilidade, chamados também de Tríade CIA. Servia para orientar as organizações em escolher as tecnologias, políticas e práticas para proteger seus sistemas de informação.

Com a evolução da tecnologia foi se criando novos pilares ou complementos para a Tríade CIA, para que sempre se tenha a boa prática e garantir uma segurança forte sempre que surgir uma nova tecnologia.

Nos tempos atuais se tem 8 pilares ou 5 complementos para a Tríade CIA, sendo eles e suas definições:

Confidencialidade: Ela garante que a informação seja acessível apenas por pessoas, entidades ou processos autorizados, fazendo assim manter o sigilo e segurança dos dados. É importante para proteger informações como propriedade intelectual, diagramas de rede e dados de produção, que poderiam ser usados por concorrente ou para planejar um ataque.

Integridade: Ela assegura que a informação seja mantida em seu estado original, exata, completa e que não tenha sido alterada, excluída ou danificada de forma não autorizada, seja por acidente ou intencionalmente. É vital garantir que os comandos de controle, as leituras de sensores e as lógicas de programação não sejam modificados por atacantes. Sendo um grande perigo por exemplo a alteração de fórmula de um produto químico ou na pressão de uma caldeira, podendo gerar um perigo catastrófico.

Disponibilidade: Ele garante que os sistemas, as aplicações e os dados estejam acessíveis e operacionais para os usuários autorizados sempre que necessário, sem interrupções. É um pilar importante, pois uma interrupção na

rede ou nos sistemas de controle pode parar toda a produção, e em casos graves levar a condições perigosas.

Autenticidade: Ela garante a veracidade e a validade de uma informação, sistema ou usuário. Sendo assim ela confirma que o emissor ou a origem de uma informação é realmente quem ou o que afirma ser. Por exemplo, garante que o operador que está enviando um comando para abrir uma válvula é realmente um operador autorizado, ou que uma mensagem de um funcionário para o outro não foi forjada por um invasor. Para se proteger é necessário por exemplo a identificação de dois fatores e certificados digitais.

Irretratabilidade / Não Repúdio: Ele garante que um indivíduo ou sistema não possa negar ter realizado uma ação. Por exemplo ter enviado um comando ou uma transação. Isso é importante para uma auditoria e responsabilização.

Legalidade: Ele garante que todas as práticas e políticas de segurança estejam em conformidade com as leis e regulamentos. Como a LGPD no Brasil.

Privacidade: Ela garante que dados pessoais ou informações sensíveis sobre indivíduos sejam coletados, usados, armazenados e compartilhados de forma justa, legal e com o consentimento do titular.

Auditoria/Rastreabilidade: Ela é o processo de registro e análise sistemática de eventos e atividades nos sistemas e redes. Garante que haja um registro imutável de “quem fez o quê, quando e onde”, permitindo a detecção de violações, a comprovação de incidentes e a garantia de não repúdio. Por exemplo ela garante que se um PLC for reprogramado ou se um comando crítico for emitido, a identidade do operador, o terminal utilizado e o horário da ação fiquem registrados.

6.4 Aplicando as Políticas de segurança da informação.

As políticas de segurança da informação (PSI) consistem em um conjunto de diretrizes, normas e procedimentos oficiais definidos por uma organização com o objetivo de proteger seus ativos de informação. Elas funcionam como um guia para que todos os colaboradores e partes interessadas tratem as informações de maneira segura, a fim de assegurar a continuidade dos negócios, reduzir riscos e atender às exigências legais e regulatórias, como a Lei Geral de Proteção de Dados (LGPD).

Os princípios principais da segurança da informação, que as políticas querem proteger, são os pilares da segurança da informação, informados anteriormente. Sendo os principais Confidencialidade, Integridade, Disponibilidade, Autenticidade e Não Repúdio.

A principal norma/padronização que vai ser usado na fábrica será a ISO/IEC 27001 sendo o principal framework para estabelecer, implementar, manter e melhorar continuamente a segurança. A política de segurança será desenvolvida com base nos requisitos e controles dela.

A norma estabelece vários requisitos que cobrem diversas áreas além da TI, como a política de segurança da informação, gestão de ativos, segurança de recursos humanos, controle de acesso, criptografia, segurança física e do ambiente, relações com fornecedores, e muitos outros pontos para a segurança da organização.

Ela não estabelece apenas controles técnicos, mas fornece uma estrutura para um Sistema de Gestão de Segurança da Informação (SGSI).

Ela faz com que a organização estabeleça, implemente, mantenha e melhore continuamente um SGSI. Ela faz uma abordagem baseada em riscos, onde exige uma identificação e avaliação sistemática dos riscos de segurança da informação. Também permite a seleção de controle apropriados para tratar esses riscos e reduzi-los a níveis aceitáveis.

Os principais pontos de importância voltados a segurança da informação são:

- Aumento de Resiliência Operacional, onde exige planos de continuidade e gestão de incidentes, que prepara a organização

para prevenir, detectar, responder e se recuperar rapidamente de falhas ou ataques cibernéticos, garantindo a continuidade e disponibilidade dos sistemas e processos industriais.

- Conformidade Regulatória e Legal, que ajuda a entender a requisitos legais, como leis de proteção de dados (LGPD) e regulamentos específicos para o setor da indústria.
- Vantagem competitiva e Confiança, onde garante a demonstração de um compromisso sério com a proteção dos dados para os clientes, fornecedores e parceiros.
- Redução de Custos com Incidentes, implementando uma gestão de riscos e controles preventivos, reduz a probabilidade de violações de dados, paralisações de produção e danos à reputação.
- Melhoria Continua da Segurança, o SGSI é um ciclo Plan-Do-Check-Act (PDCA), o que significa que a segurança sempre está sendo monitorada, revisada e aprimorada.
- Cultura de Segurança Consolidada, a norma exige treinamento e conscientização de todos os colaboradores, fortalecendo a cultura de segurança na empresa e transformando o fator humano de vulnerabilidade em um ativo de proteção.

Seguindo a norma vai ser possível ter uma boa segurança cibernética, fazendo com que a produção não pare por conta de invasões ou falhas dos sistemas, gere uma boa reputação para os clientes e parceiros, mostrando a segurança de seus dados. E assim fazendo com que a organização cresça, gerando mais lucro.

6.5 Conhecendo os principais protocolos de SI.

A cibersegurança usa diversos Protocolos de Segurança da Informação (SI) para garantir certos pilares da segurança da informação sendo eles Confidencialidade, Integridade, Disponibilidade e Autenticidade das comunicações de dados. Os principais protocolos de SI e suas características são:

- **SSL/TLS (Transport Layer Security / Secure Sockets Layer):** É uma criptografia de tráfego, onde estabelece uma conexão segura e criptografada entre um servidor (como um site) e um cliente (como um navegador). Além de garantir a confidencialidade com uma criptografia forte, também garante uma autenticação, geralmente por certificados digitais e a integridade dos dados, prevenindo modificações. SSL é um protocolo antigo, mas seu nome ficou popular. Já o TLS é o atual e mais seguro que o SSL.
- **HTTPS (Hypertext Transfer Protocol Secure):** Serve como o segurança da navegação web, combinando o protocolo HTTP junto com SSL/TLS, garantindo que o HTTP possa ser executado dentro do “túnel” que o SSL/TLS estabelece. Essencialmente usado por sites de comércio e bancos, e sites onde se tem login e senhas ou dados sensíveis.
- **IPsec (Internet Protocol Security):** É um conjunto de protocolos que fornece a segurança na camada de rede, que fica abaixo de TLS/SSL/HTTPS. Protege a comunicação em nível de IP. Usado principalmente para criar VPNs seguras. Garantindo a autenticação, integridade e confidencialidade dos dados. Funciona como um transporte, protegendo a carga útil, e o túnel onde encapsula o pacote IP inteiro.
- **SSH (Secure Shell):** É um protocolo usado para acesso remoto seguro a sistemas, como por exemplo, servidores. Utiliza criptografia para

proteger a comunicação. Tem uma forte autenticação, geralmente por senhas ou chaves criptografadas. E também pode ser usado para uma transferência segura de arquivos. Ele substituiu protocolos antigos que agora não são mais seguros, como o Telnet e o FTP.

- Kerberos: É um protocolo de autenticação de rede que permite que os usuários acessem serviços em uma rede distribuída sem precisar das credenciais. É baseado em criptografia de chave simétrica. Utiliza um terceiro confiável para autenticar usuários e conceder “tickets”, é usado como protocolo de autenticação padrão no Windows Active Directory. Protege contra escuta e ataques de replay.

DNSSEC (Domain Name System Security Extensions): É uma extensão de segurança para o DNS (Sistema de Nomes de Domínio). Seu objetivo é autenticar as respostas do DNS para garantir que os usuários cheguem ao servidor correto. Adicionando assinaturas digitais aos dados do DNS. Combate o “Cache Poisoning” (envenenamento de cache) e outros ataques de spoofing (falsificação) de DNS. Garante a integridade e autenticidade das informações de mapeamento de nomes, como um nome de site para um IP, mas não oferece confidencialidade, as consultas não são criptografadas.

6.6 Aplicando mais conceitos para a Cibersegurança da fábrica

Mais alguns conceitos importantes para a segurança podem ser aplicados para a empresa, como:

6.6.1 Senhas com MFA

É um método de segurança que exige mais de uma forma de verificação para acessar um sistema, conhecido como uma autenticação de dois fatores.

Além da senha também precisa de confirmação em algum aplicativo no celular, para o acesso. Isso evita invasões mesmo que a senha seja comprometida. Será usado o Google Authenticator para o fator de dois fatores da empresa, que é simples e amplamente usado, muito usado em sistemas internos, ERPs e plataformas de nuvem.

6.6.2 Firewall

É uma muralha que controla o tráfego de rede, age entre fábrica e internet, permitindo conexões seguras e bloqueando conexões suspeitas. Foi optado como firewall da empresa o Palo Alto NGFW, o melhor para uma segurança avançada, um dos mais usados em data centers e multinacionais, tem um altíssimo nível de inspeção de tráfego e é muito forte em análise comportamental e prevenção de ameaças.

6.6.3 Criptografia

É a técnica de codificar informações, onde só pessoas autorizadas consigam ler os dados, protegendo os dados em trânsito na rede e em repouso, armazenadas. Como ferramenta para isto será usado OpenSSL que é uma implementação de código aberto dos protocolos SSL e TLS, onde a biblioteca implementa as funções básicas de criptografia, usado para certificados, HTTPS e geração de chaves. Lembrando que praticamente todo software, aplicativo ou serviço moderno já usa algum tipo de criptografia.

6.6.4 Controle de Acesso

É um sistema que limita o acesso dos usuários com base em suas funções, garantindo que cada funcionário só acesse, visualize ou modifique apenas o que é necessário para o seu trabalho. Usando o Active Directory (AD), ele controla os logins, acessos e autentificação de colaboradores, sendo

um sistema mais usado no mundo para gerenciar usuários, grupos e permissões.

6.6.5 Backup e Recuperação

É o processo de criar cópias dos dados e sistemas, mantendo cópias seguras dos dados e sistemas para restaurar após falhas ou ataques. Será usado servidores de nuvem que oferecem este recurso, que será o AWS (Amazon Web Services) onde tem o backup integrado e sendo excelente para recuperação pós-desastre.

6.6.6 Monitoramento e Detecção (IDS/IPS)

São ferramentas que observam o tráfego da rede para identificar e bloquear atividades suspeitas ou ataques. Detectando comportamentos anormais na rede. Será usado o Suricata, ele detecta ataques, anomalias, tráfego suspeito, suporta alta performance e múltiplos núcleos, muito usado em redes industriais e ambientes IoT.

6.6.7 Política de Segurança

É um conjunto de regras e diretrizes que definem como proteger sistemas, dados e usuários dentro da empresa. Envolve boas práticas para todos os funcionários e sistemas da indústria. Como explicado antes seguiremos uma norma de segurança já padronizada a ISO/IEC 27001. Mas para uma melhor tendência foi criado 10 regras principais para a empresa:

6.6.7.1 Objetivo

Estabelecer diretrizes básicas para o uso seguro das informações, sistemas e recursos tecnológicos da empresa, garantindo confidencialidade, integridade e disponibilidade dos dados, bem como a proteção contra incidentes cibernéticos.

6.6.7.2 Abrangência

Aplica-se a todos os colaboradores, estagiários, terceirizados e visitantes que utilizam recursos tecnológicos ou têm acesso a informações da empresa, seja em ambiente físico ou remoto.

6.6.7.3 - Penalidades

O não cumprimento destas políticas poderá resultar em advertências, suspensão de acesso ou medidas disciplinares, conforme a gravidade da infração.

6.6.7.4 Comprometimento do Colaborador

Ao acessar os sistemas e recursos tecnológicos da empresa, o colaborador declara estar ciente e de acordo com as regras desta Política de Segurança da Informação.

6.6.7.5 Regras Gerais de Segurança

- Utilizar recursos de TI exclusivamente para fins profissionais.
- É proibido o uso de sistemas ou redes corporativas para atividades pessoais, ilegais ou não autorizadas.
- Todos os dispositivos conectados à rede devem estar protegidos por antivírus atualizado e senhas seguras.
- É proibida a instalação de softwares sem autorização do setor de TI.
- Qualquer incidente de segurança deve ser comunicado imediatamente ao responsável pela área de cibersegurança.

6.6.7.6 Política de Senhas

- As senhas devem ter mínimo de 12 caracteres, com letras maiúsculas, minúsculas, números e símbolos.
- A troca deve ocorrer a cada 90 dias.
- É proibido compartilhar senhas com outros colaboradores.
- Deve-se usar autenticação multifator (MFA).
- Senhas não devem ser anotadas nem armazenadas em locais públicos ou não criptografados.

6.6.7.7 Uso de Dispositivos e Acesso à Rede

- O uso de pen drive, notebooks pessoais ou celulares em equipamentos da empresa deve ter autorização prévia.
- Todos os dispositivos conectados à rede industrial devem seguir as normas de segurança de IoT e segmentação de rede.
- O acesso remoto deve ser realizado somente por VPN corporativa segura.

6.6.7.8 Proteção de Dados e Privacidade

- É proibido compartilhar informações internas sem autorização.
- Dados sensíveis (clientes, projetos, sensores, máquinas, etc.) devem ser tratados conforme a LGPD.
- Backups devem ser realizados regularmente e armazenados em local seguro.
- Todo colaborador é responsável por zelar pela confidencialidade das informações industriais

6.6.7.9 Redes Sociais e Comunicação

- É proibido divulgar informações da empresa, imagens de maquinários, processos produtivos ou dados técnicos em redes sociais sem autorização.
- O e-mail corporativo deve ser usado apenas para comunicações profissionais.
- Links suspeitos e anexos desconhecidos devem ser evitados para prevenir ataques de phishing.

6.6.7.10 - Inovação e Novas Tecnologias

- O uso de IA, sensores IoT, robôs e sistemas automatizados deve seguir normas internas de segurança e passar por análise de risco antes da implementação.
- Tecnologias experimentais devem ser testadas em ambientes controlados e isolados da rede de produção.

6.7 Topologia para a segurança da organização.

Figura 42: Topologia da rede

Fonte: Autores, 2025

Conclusão

O projeto em questão mostrou habilidade para unir, de forma coesa e organizada, a variedade de matérias estudadas durante o semestre. Cada elemento teórico e prático foi integrado de maneira deliberada, com o objetivo de não só utilizar as tecnologias específicas de cada campo, mas também fomentar uma interação harmoniosa entre elas para maximizar seus resultados.

Todo o processo de concepção, planejamento e desenvolvimento foi realizado com rigor, garantindo que cada fase estivesse em conformidade com os objetivos estabelecidos e que o funcionamento geral do sistema fosse eficiente e sem interferências. Assim, o projeto não só consolidou os conhecimentos adquiridos, mas também destacou a importância da colaboração multidisciplinar na criação de soluções tecnicamente sólidas e coerentes.
